Appendix Details

This appendix includes robustness checks for “Conflict Environments and Civil War” (Reid, Myrick, Kadera, and Crescenzi 2020).

These robustness checks include the following:

1. **Tables 1-4:** Comparison of the CE Score to standard spatial lags using UCDP/PRIO Armed Conflict Data (ACD) and data from the Correlates of War (COW).
2. **Tables 5-8:** Comparison of the CE score to alternative measures of regional and neighborhood conflict
3. **Table 9:** Robustness of central findings to alternative dependent variable that sets ongoing civil war years to 0
4. **Table 10:** Robustness of central findings to alternative measures of ethnic diversity
5. **Table 11:** Robustness of central findings to alternative measures of democracy and political stability
6. **Table 12-13:** Robustness of central findings when controlling for different world regions
7. **Table 14:** Replication of central findings with CE score that uses a 2000km minimum distance threshold
8. **Table 15:** Replication of central findings with onsets fought over territory versus government control.

In addition to these robustness checks, we replicate three analyses. We have selected these three analyses because they are, respectively, (1) the canonical study of civil war onset, (2) a highly cited early study of civil war contagion, and (3) a more contemporary investigation of neighboring conflict. We show that adding the CE score to existing models improves the explanatory power of the models without significantly changing the core findings of the authors. In Table 17 and Table 18, we further demonstrate that a measure that accounts for both spatial and temporal dimensions outperforms other measures of neighborhood conflict.

1. **Table 16:** Replication of Fearon and Laitin (2003) with CE score
2. **Table 17:** Replication of Buhaug and Gleditsch (2008) with CE score
3. **Table 18:** Replication of Bara (2017) with CE score

Replication files for this research can be found at: [<http://dx.doi.org/10.7910/DVN/NDZV42>]
